How to do vlookup in two different excel sheets. How to compare multiple columns in different excel sheets using vlookup. How to compare two different excel sheets using vlookup. How to do vlookup in excel different sheets. How to find duplicate values in different excel sheets using vlookup. How to compare two columns in different excel sheets using vlookup. How to use vlookup in excel 2016 for different sheets. How to compare data in two different excel sheets using vlookup.

rng means E2 cell. FinalResult means value returned by the VLOOKUP function. Declaring variables and assigning data type is the important thing here. Vlookup(lookup_value, Table, Range, 2, False) rng = FinalResult End Sub Lookup value is set to D2 cell in the name of LookupValue. Table Array is set to A2 to B7 in the name of Table. Range. Based on this we look for a value in the table. Using DIM statement I have declared two variables one is rng & another one is FinalResult. rng holds Range as the variable and FinalResult holds Variant as the variable. This is actually where I need the result to be displayed. In a table, there are many columns, out of many columns we only require the column which we are looking for the data. From this table using lookup value, we will fetch the data. FinalResult gets the data from the function VLOOKUP. Sub Vlookup Example1() Dim rng As Range, FinalResult As Variant, Table Range As Range, LookupValue As Range Set rng = Sheets("Example 1").Range("E2") Set Table Range = Sheets("Example 1").Range("A2:B7") Set LookupValue = Sheets("Example 1").Range("D2") FinalResult = Application. Recommended Articles This is a guide to Excel VBA VLOOKUP function. Vlookup function of excel can be used in the VBA as well with the same syntax that we used in Excel. Open a module in VBA and define a variable for Lookup value and then declare the cell where we will be applying Vlookup using VBA. Let us now see how to use VBA VLOOKUP function in Excel with the help of some examples. Column Index Number: This is the column number from the table we are looking for. How to Use VBA VLOOKUP Function in Excel? Step 3: Select Customize Ribbon. Here I am going to create names and apply the same in the VLOOKUP. The code will be the same as the previous example. Line 4: rng = FinalResult Initial variable rng is equal to the value of FinalResult. You can also use through our other suggested articles VBA VBA RGB VBA Object VBA Solver VBA Login Step 1: Go to the Developer tab and click on Visual Basic Step 2: Once you click on Visual Basic it will open the below window for you Step 3: Click on Insert and select Module Step 4: Once you click on Module it will insert the new module for you. Here we discuss the VLOOKUP Formula and how to use VBA VLOOKUP in Excel along with practical examples and downloadable excel template. Step 5: Copy and paste the below code to your newly inserted module. Step 5: A rectangular shape has become a macro button. Line 3: FinalResult = Application. If we want the exact match we need to mention as FALSE or 0, if we want the approximate match we can mention as TRUE or 1. I am assigning Example 1 macro name to the rectangular shape. Now you must see the Developer tab in the Ribbon. We do not see any kind of formula. In cell E2, I want to know the sales value of TV using VBA VLOOKUP function. Things to Remember About VBA VLOOKUP In VBA too VLOOKUP works the same as the worksheet function. Now as per syntax of Vlookup in VBA select the lookup value, lookup range or table, Column index number and range lookup is TRUE or FALSE. Step 1: Click on File. WorksheetFunction. Step 6: Hit the RUN button or Press F5 to execute the code Step 7: We will get the below output. Table Value: This is the table which holds all the values. WorksheetFunction.Vlookup (Range("A2:D2"), Range("A2:B7"), 2, False) This is the important line of the code. Create a Macro Button Once the macro code is written we need to design the macro. Line 2: Set rng = Sheets("Example 1").Range("E2") Previous declared variable rng is an object variable so we need to set to which range actually we are referring to. Step 1: Go to Insert and Select the rectangular shape. You can change the lookup value cell D2 and get the result. In the below image, I have changed the D2 cell value to Mobile. VBA is under Developer tab in excel. Double click on that newly inserted module to write your VLOOKUP code. Where to Write Macros? Line 1: Dim rng as Range, FinalResult as Variant This is the first line of the code. Step 4: On the right-hand side make sure the checkbox of the Developer tab is ticked. How to Use VBA VLOOKUP in Excel? Formula of VLOOKUP Function The Formula includes 4 mandatory arguments. Lookup Value: This is the base values you are searching. Step 4: Once you click on Assign Macro it will open up all the macro names. Now, if we run the code, then we will be able to see the lookup value in a declared cell in Excel. Example #2 Take the same data from the above example. Only in VLOOKUP, I am changing references. I have set the range to E2 cell. Any value returned by VBA function does not hold any kind of formula. Step 2: Under File, click on Options. It has product name and sales made against that product. Once you click on the rectangular shape, you will get the below output. Sub Vlookup Example1() Dim rng As Range, FinalResult As Variant Set rng = Sheets("Example 1").Range("E2") FinalResult = Application. VBA VLOOKUP Function is very simple to use. Range Lookup: Here we need to specify what kind of result we want. FinalResult holds the variable of the variant i.e. any kind of data type. VBA VLOOKUP Function (Table of Contents) Where to Write Macros? What is VBA VLOOKUP Function? Select the macro name you wish to assign. Vlookup(Range("D2"), Range("A2:B7"), 2, False) rng = FinalResult End Sub Let me break down the code to explain it to you. Example #1 I have a sales table for different products. Step 2: Draw a rectangular shape Step 3: Once the Rectangular shape has drawn right click on the rectangular shape and click on Assign Macro. If you are not able to find the developer tab follow the below steps to unhide this. this.

23/01/2022 - Note: this guide uses Microsoft Excel to perform the VLOOKUP, but you can use the same method with Google Sheets. Also read: How to Use the Concatenate Function in Excel How to Filter Data Using Multiple Criteria. VLOOKUP was designed to only pull up a single value, and there are other functions for looking up multiple sources of information - that's not to say that ... In this Excel tutorial, I will show you different methods to compare two columns in Excel and look for matches or differences. There are multiple ways to do this in Excel and in this tutorial I will show you some of these (such as comparing using VLOOKUP formula or IF formula or Conditional formatting). 10/11/2021 - If you have two big columns and you want to compare them, you can use Excel's VLOOKUP function. In this article, I will show how you can use VLOOKUP formula to compare two columns on different sheets. Read more: How to Pull Data from Multiple Worksheets in Excel We have two worksheets (SSA and Mongabay) as below. In the SSA worksheet, you will find the ... Supposing there are two tables in two sheets in a workbook, you want to merge table 2 to the table 1 by using VLOOKUP function as below screenshot shown. Here this article, introduces the two methods on solving this job. Merge two tables by VLOOKUP . Merge two tables by Kutools for Excel's handy tool-Tables Merge. Sample file
